

Statistical Modeling Course

Collinearity Lab

This lab focuses on the *collinearity* problem. Perform the following commands in [R](#) . The last line corresponds to creating a linear model in which y is a function of x_1 and x_2 .

```
set.seed(1)
x1 = runif(100)
x2 = 0.5*x1 + rnorm(100)/10
y = 2 + 2*x1 + 0.3*x2 + rnorm(100)
df = tibble(y, x1, x2)
```

Problem 1

What is the correlation between x_1 and x_2 ? What is the variance inflation factor? How about the condition number of $X^T X$?

```
cor(df$x1, df$x2)
```

```
## [1] 0.8351212
```

```
vif(lm(y~., data=df))
```

```
##          x1          x2
## 3.304993 3.304993
```

```
kappa(df[, -1])
```

```
## [1] 8.556306
```

Problem 2

Using this data, fit a least squares regression to predict y using x_1 and x_2 . How do these relate to the true β_0 , β_1 , and β_2 ? Can you reject the null hypothesis $H_0 : \beta_1 = 0$? How about the null hypothesis $H_0 : \beta_2 = 0$?

```
mod <- lm(y~., data=df)
summary(mod)
```

```
##
## Call:
## lm(formula = y ~ ., data = df)
##
```

```
## Residuals:
##      Min       1Q   Median       3Q      Max
## -2.8311 -0.7273 -0.0537  0.6338  2.3359
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)   2.1305     0.2319   9.188 7.61e-15 ***
## x1            1.4396     0.7212   1.996  0.0487 *
## x2            1.0097     1.1337   0.891  0.3754
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 1.056 on 97 degrees of freedom
## Multiple R-squared:  0.2088, Adjusted R-squared:  0.1925
## F-statistic: 12.8 on 2 and 97 DF,  p-value: 1.164e-05
```

Answer: For the following model, we can reject the null hypothesis that $B_1=0$ but we cannot reject the null hypothesis that $B_2=0$.

Problem 3

Now fit a least squares regression to predict y using only x_1 . Comment on your results. Can you reject the null hypothesis $H_0 : \beta_1 = 0$?

```
mod2 <- lm(y~x1, data=df)
summary(mod2)
```

```
##
## Call:
## lm(formula = y ~ x1, data = df)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -2.89495 -0.66874 -0.07785  0.59221  2.45560
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)   2.1124     0.2307   9.155 8.27e-15 ***
## x1            1.9759     0.3963   4.986 2.66e-06 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
```

```
## Residual standard error: 1.055 on 98 degrees of freedom
## Multiple R-squared:  0.2024, Adjusted R-squared:  0.1942
## F-statistic: 24.86 on 1 and 98 DF,  p-value: 2.661e-06
```

Answer: In this model, we can reject the null hypothesis that $B_1=0$.

Problem 4

Now fit a least squares regression to predict y using only x_2 . Comment on your results. Can you reject the null hypothesis $H_0 : \beta_1 = 0$?

```
mod3 <- lm(y~x2, data=df)
summary(mod3)

##
## Call:
## lm(formula = y ~ x2, data = df)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -2.62687 -0.75156 -0.03598  0.72383  2.44890
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)   2.3899     0.1949   12.26 < 2e-16 ***
## x2            2.8996     0.6330    4.58 1.37e-05 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 1.072 on 98 degrees of freedom
## Multiple R-squared:  0.1763, Adjusted R-squared:  0.1679
## F-statistic: 20.98 on 1 and 98 DF,  p-value: 1.366e-05
```

Answer: In this model, we can reject the null hypothesis that $B_2=0$.

Problem 5

Do the results obtained in Problem 2 and 4 contradict each other? Explain your answer.

Answer:

The results in Problem 2 and 4 show what happens when the predictor variables are highly correlated with each other. The results contradict each other. Since x_1 and x_2 have high correlation, then using them both in a model to predict y results in x_2 having no statistically significant relationship

with y . However, using them separately in two models results in each having significant linear relationship with y .
